Arya Kondawar (IMT2020084)
Paras Vekariya (IMT2020547)
Anshul Madurwar (IMT2020554)

Problem Statement

Given any input simplicial complex (up to 3-dimensional), compute β_0 using the boundary matrix method.

Algorithm

We have used the formula given below in our code to calculate β_0 :

$$\beta_0 = \dim(H_0(K)) = \dim(C_0(K)) - \dim(\text{Im}(\partial_1)) \quad (1)$$

In our program we take vertices, edges and faces (it is redundant) as input (from a .gts file). We then create a matrix corresponding to the linear transformation ∂_1 and then compute $\dim(\text{Im}(\partial_1))$, i.e. the $\text{rank}(\partial_1)$.

As we know,

$$\partial_1(\overline{v_1 v_2}) = \overline{v_2} - \overline{v_1}$$

As we also know $C_0(K)$ is the vector space of 0-chains $\implies \dim(C_0(K)) = \text{number of vertices}$.

By using all the above facts we can easily calculate β_0 for a simplicial complex.

Implementation Steps

1. First we ask for filename as input from user (.gts file) (in main() function). We open the file corresponding to this filename. From here we get the number of vertices, edges and faces in the input simplicial complex, i.e. $\dim(C_0(K))$.
2. In the next step we create the matrix corresponding to ∂_1 using the edges of the input.
3. In the last and the final step we calculate β_0 using equation 1.

Steps to run the code

1. Open the terminal.
2. Enter the command "pip3 install sympy".
3. Enter the command "pip3 install numpy".
4. Enter the command "pip3 install scipy".
5. Enter the command "python3 topo.py".
6. Enter the filename of the .gts file you want to take input from.
7. Press Enter to get the final result.

NOTE:- Here the code may take time to calculate the result for very large data (depending on the system hardware specifications).

Demo Results

```
(base) karanjitsaha@pop-os:~/Desktop/TOPOLOGY PROJECT$ python3 topo.py
Enter the filename for reading the data
seashell.gts
The number of vertices are: 915
The number of edges are: 2594
The number of faces are: 1680
=====
|  $\beta_0 = 1$  |
